Understanding the AP Biology Curriculum

The AP Biology curriculum is designed to cover a wide range of topics within the field of biology. It emphasizes scientific practices, core concepts, and the connections between different biological systems. The course is structured around four big ideas that encapsulate the essence of biology.

The Four Big Ideas

The curriculum is organized around four big ideas that guide students through the complexities of biological sciences:

- **Big Idea 1: Evolution** – This idea revolves around the understanding of the processes that lead to the diversity of life on Earth, emphasizing natural selection and genetic variation.
- **Big Idea 2: Cellular Processes** – It focuses on the molecular basis of life, including cellular respiration, photosynthesis, and cellular communication.
- **Big Idea 3: Organismal Biology** – This includes the study of organisms and their interactions with each other and the environment, highlighting physiological and ecological principles.
- **Big Idea 4: Biological Systems** – This idea addresses how biological systems interact and function as a whole, incorporating the principles

of homeostasis and feedback mechanisms.

Each of these big ideas is supported by enduring understandings, essential questions, and science practices that enable students to engage deeply with the subject matter.

Key Themes in AP Biology

In addition to the four big ideas, several key themes permeate the AP Biology curriculum, providing a framework for understanding the interconnectedness of biological concepts.
