Biomarkers

Biomarkers are biological indicators that can be measured and evaluated as indicators of health or disease. They play a critical role in advanced clinical chemistry by enabling the identification of disease states, monitoring disease progression, and assessing responses to treatment. Commonly used biomarkers include:

- Enzymes (e.g., liver enzymes such as ALT and AST)
- Hormones (e.g., insulin, thyroid hormones)
- Proteins (e.g., C-reactive protein, troponin)
- Metabolites (e.g., glucose, cholesterol)

Quality Control and Assurance

Ensuring the accuracy and reliability of test results is paramount in clinical chemistry. Quality control measures involve systematic monitoring of laboratory processes and results through:

- Regular calibration of equipment
- Use of control samples
- Routine audits and proficiency testing

Methods and Techniques

Advanced clinical chemistry employs a variety of methods and techniques to analyze samples. These methods are crucial for obtaining accurate and timely results that inform clinical decision-making.

Biochemical Analysis

Biochemical analysis involves the examination of various compounds in biological fluids. Techniques such as spectrophotometry, chromatography, and electrophoresis are commonly used to separate and quantify substances. Each method has its advantages and applications, such as:

- **Spectrophotometry:** Measures the intensity of light absorbed by a sample, useful for determining concentrations of metabolites.

- **Chromatography:** Separates mixtures into individual components, allowing for detailed analysis of complex biological samples.
- **Electrophoresis:** Separates molecules based on size and charge, commonly used for protein analysis.

Molecular Diagnostics

Molecular diagnostics has revolutionized the field of clinical chemistry by enabling the detection of genetic disorders and infectious diseases at the molecular level. Techniques such as polymerase chain reaction (PCR) and next-generation sequencing (NGS) are at the forefront of this advancement.

Instrumentation Used in Clinical Chemistry
