Multiple-Choice Questions

In the multiple-choice section, students will encounter a total of 60 questions, which are divided into two types: standalone questions and questions based on laboratory scenarios. This section accounts for 50% of the exam score. Students must demonstrate their knowledge across various chemistry topics, including the following:

- Atomic structure and properties
- Intermolecular forces and bonding
- Reactions and stoichiometry
- Kinetics and equilibrium
- Thermodynamics and thermochemistry

Free-Response Questions

The free-response section includes 7 questions, which account for the remaining 50% of the total score. This section requires students to construct detailed responses, often involving calculations and explanations. The free-response questions can include:

- Long-form questions requiring comprehensive explanations
- Short-answer questions that may involve calculations or chemical equations
- Laboratory-based questions that assess experimental design and data interpretation
